G. M. VEDAK INSTITUTE OF TECHNOLOGY, TALA
Department of Civil Engineering

Academic Year 2016 -17

Report

Title of the course : "AUTOCAD 2017 (2D & 3D)"
Organized by : Department of Civil Engineering.
Held at : G. M. Vedak Institute of Technology,
Raigad, Off Indapur, Tala, Maharashtra 402111

Date : 20/01/17 to 12/03/17

The value added courses on "AUTOCAD 2017 (2D & 3D)" was held at Civil Engineering Department, G. M. Vedak Institute of Technology, in the month of January and March 2017. There were 30 participants for AUTOCAD 2017 (2D & 3D). The AUTOCAD courses was conducted by SK Technical solutions. This

courses provided platform to learn fundamental concepts of AutoCAD its applications. The participants furnish positive feedback about the courses.

Course contents which were covered in AUTOCAD 2017 are:

1. AutoCAD 2017 Tutorial First Level 2D Fundamentals
2. AutoCAD 2017 Tutorial Second Level 3D Modeling

Objectives:

The objective of this course is to teach users the basic commands and tools necessary for professional 2D and 3D drawing, design and drafting using AutoCAD. After completing this course users will be able to:

- Use AutoCAD for daily working process.
- Navigate throughout AutoCAD using major navigating tools.
- Understand the concept and techniques to draw.
- Create multiple designs using several of tools.
- Create layers to control the objects' visibility.
- Explain drawing using annotations.
- Plot or print the drawing by scale.
- To use constraint for certain design.

Shri. Gopinath Mahadeo Vedak Pratishthan's

Academic Year 2016-2017

NOTICE

AUTOCAD 2017 (2D & 3D)

All students SE, TE and BE Civil Engineering are here by informed that course on, "AUTOCAD 2017 (2D & 3D)" arranged on 20/01/17 to 12/03/17.

Event Coordinator

HOD

Drawing Units Setup

Every object we construct in a CAD system is measured in **units**. We should determine the system of units within the CAD system before creating the first geometric entities.

In the **Menu Bar** select: **[Format] → [Units]**

The AutoCAD **Menu Bar** contains multiple pull-down menus where all of the AutoCAD commands can be accessed. Note that many of the menu items listed in the pull-down menus can also be accessed through the **Quick Access** toolbar and/or **Ribbon** panels.

2. Click on the **Length Type** option to display the different types of length units available. Confirm the **Length Type** is set to **Decimal**.

3. On your own, examine the other settings that are available.

4. In the **Drawing Units** dialog box, set the **Length Type** to **Decimal**. This will set the measurement to the default **English** units, inches.

5. Set the **Precision** to two digits after the decimal point as shown in the above figure.

6. Pick **OK** to exit the **Drawing Units** dialog box.

Drawing Area Setup

Next, we will set up the **Drawing Limits** by entering a command in the command prompt area. Setting the **Drawing Limits** controls the extents of the area. It also serves as a visual reference that marks the working plot option that defines an area to be plotted/printed. Note that this setting does not limit the region for geometry construction.

1. In the **Menu Bar** select: **[Format] → [Drawing Limits]**

2. In the command prompt area, the message "**Reset Model Space Limits: Specify lower left corner or [On/Off] <0,0,0,0>**" is displayed. Press the **ENTER** key once to accept the default coordinates **<0,0,0,0>**.

3. In the command prompt area, the message "**Specify upper right corner <12.00,9.00>**" is displayed. Press the **ENTER** key again to accept the default coordinates **<12.00,9.00>**.

4. On your own, move the graphics cursor near the upper-right corner inside the drawing area and note that the drawing area is unchanged. (The **Drawing Limits** command is used to set the drawing area, but the display will not be adjusted until a display command is used.)

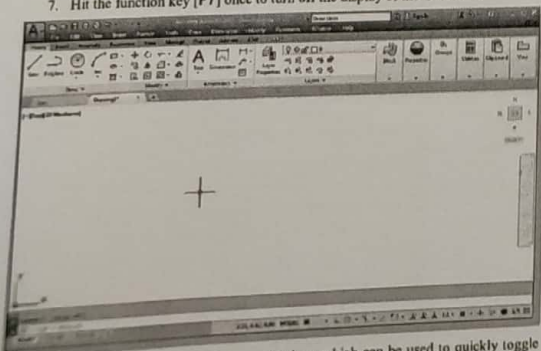

5. Inside the **Menu Bar** area select: **[View] → [Zoom] → [All]**

The **Zoom All** command will adjust the display so that all objects in the drawing are displayed to be as large as possible. If no objects are constructed, the **Drawing Limits** are used to adjust the current viewport.

6. Move the graphics cursor near the upper-right corner inside the drawing area and note that the display area is updated.

7. Hit the function key **[F7]** once to turn off the display of the **Grid** lines.

Note that function key **[F7]** is a quick key, which can be used to quickly toggle on/off the grid display. Also, note the **command prompt** area can be positioned to dock below the drawing area or float inside the drawing area as shown.

Drawing Lines with the Line Command

1. Move the graphics cursor to the first icon in the **Draw** panel. This icon is the **Line** icon. Note that a brief description of the **Line** command appears next to the cursor.

2. Select the icon by clicking once with the **left-mouse-button**, which will activate the **Line** command.

3. In the command prompt area, near the bottom of the AutoCAD drawing screen, the message "**line Specify first point:**" is displayed. AutoCAD expects us to identify the starting location of a straight line. Move the graphics cursor inside the graphics window and watch the display of the coordinates of the graphics cursor at the bottom of the AutoCAD drawing screen. The three numbers represent the location of the cursor in the X, Y, and Z directions. We can treat the graphics window as if it was a piece of paper and we are using the graphics cursor as if it were a pencil with which to draw.

We will create a freehand sketch of a five-point star using the **Line** command. Do not be overly concerned with the actual size or accuracy of your freehand sketch. This exercise is to give you a feel for the AutoCAD 2017 user interface.

4. We will start at a location about one-third from the bottom of the graphics window. Left-click once to position the starting point of our first line. This will be *point 1* of our sketch. Next, move the cursor upward and toward the right side of *point 1*. Notice the rubber-band line that follows the graphics cursor in the graphics window. Left-click again (*point 2*) and we have created the first line of our sketch.

5. Move the cursor to the left of *point 2* and create a horizontal line about the same length as the first line on the screen.

6. Repeat the above steps and complete the freehand sketch by adding three more lines (from *point 3* to *point 4*, *point 4* to *point 5*, and then connect to *point 5* back to *point 1*).

7. Notice that the **Line** command remains activated even after we connected the last segment of the line to the starting point (*point 1*) of our sketch. Inside the graphics window, click once with the **right-mouse-button** and a popup menu appears on the screen.
 8. Select **Enter** with the left-mouse-button to end the **Line** command. (This is equivalent to hitting the **[ENTER]** key on the keyboard.)
 9. Move the cursor near *point 2* and *point 3*, and estimate the length of the horizontal line by watching the displayed coordinates for each point.

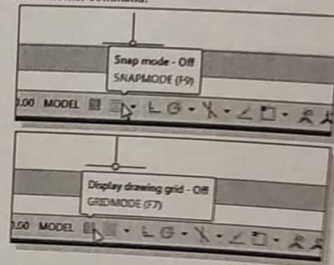

Visual Reference

The method we just used to create the freehand sketch is known as the **interactive** method, where we use the cursor to specify locations on the screen. This method is perhaps the fastest way to specify locations on the screen. However, it is easier and more helpful to know what our inch or one meter looks like on the screen while we are creating entities. AutoCAD 2017 provides us with many tools to aid the construction of our designs. For example, the **GRID** and **SNAP MODE** options can be used to get a visual reference as to the size of objects and learn to restrict the movement of the cursor to a set increment on the screen.

The **GRID** and **SNAP MODE** options can be turned **ON** or **OFF** through the **Status Bar**. The **Status Bar** area is located at the bottom left of the AutoCAD drawing screen, next to the cursor coordinates.

The second button in the **Status Bar** is the **SNAP MODE** option and the third button is the **GRID DISPLAY** option. Note that the buttons in the **Status Bar** area serve two functions: (1) the status of the specific option, and (2) as toggle switches that can be used to turn these special options **ON** and **OFF**. When the corresponding button is highlighted, the specific option is turned **ON**. Using the buttons is a quick and easy way to make changes to these drawing aid options. The buttons in the **Status Bar** can also be switched on and off in the middle of another command.

GRID ON

1. Left-click the **GRID** button in the **Status Bar** to turn **ON** the **GRID DISPLAY** option. (Notice in the command prompt area, the message "<Grid on>" is also displayed.)

2. Move the cursor inside the graphics window, and estimate the distance in between the grid lines by watching the coordinates displayed at the bottom of the screen.

The **GRID** option creates a pattern of lines that extends over an area on the screen. Using the grid is similar to placing a sheet of grid paper under a drawing. The grid helps you align objects and visualize the distance between them. The grid is not displayed in the plotted drawing. The default grid spacing, which means the distance in between two lines on the screen, is 0.5 inches. We can see that the sketched horizontal line in the sketch is about 4 inches long.

SNAP MODE ON

1. Left-click the **SNAP MODE** button in the **Status Bar** to turn **ON** the **SNAP** option.

2. Move the cursor inside the graphics window, and move the cursor diagonally on the screen. Observe the movement of the cursor and watch the coordinates display at the bottom of the screen.

The **SNAP** option controls an invisible rectangular grid that restricts cursor movement to specified intervals. When **SNAP** mode is on, the screen cursor and all input coordinates are snapped to the nearest point on the grid. The default snap interval is 0.5 inches and aligned to the grid points on the screen.

3. Click on the **Line** icon in the **Draw** toolbar. In the command prompt area, the message "<Line Specify first point:>" is displayed.

4. On your own, create another sketch of the five-pointed star with the **GRID** and **SNAP** options switched **ON**.

5. Use the **right-mouse-button** and select **Enter** in the popup menu to end the **Line** command if you have not done so.

Using the Erase Command

One of the advantages of using a CAD system is the ability to remove entities without leaving any marks. We will erase two of the lines using the **ERASE** command.

1. Pick **Erase** in the **Modify** toolbar. (The icon is a picture of an eraser at the end of a pencil.) The message "Select objects" is displayed in the command prompt area and AutoCAD awaits us to select the objects to erase.

2. Left-click the **SNAP MODE** button on the **Status Bar** to turn **OFF** the **SNAP MODE** option so that we can more easily move the cursor on top of objects. We can toggle the **Status Bar** options **ON** or **OFF** in the middle of another command.

3. Select any two lines on the screen; the selected lines are highlighted as shown in the figure below.

To deselect an object from the selection set, hold down the **[SHIFT]** key and select the object again.

4. **Right-mouse-click** once to accept the selections. The selected two lines are erased.

Repeat the Last Command

1. Inside the graphics window, click once with the **right-mouse-button** to bring up the **popup** option menu.

2. Pick **Repeat Erase**, with the left-mouse-button, in the **popup** menu to repeat the last command. Notice the other options available in the **popup** menu.

AutoCAD 2017 offers many options to accomplish the same task. Throughout this text, we will emphasize the use of the **AutoCAD Rastering Design** interface, which means we focus on the screen, not on the keyboard.

3. Move the cursor to a location that is above and to the left of the entities on the screen. Left-mouse-click once to start a corner of a rubber-band-window.

4. Move the cursor toward the right and below the entities, and then left-mouse-click to enclose all the entities inside the selection window. Notice all entities that are inside the window are selected. (Note the **enclosed window selection** direction is from top left to bottom right.)

5. Inside the graphics window, **right-mouse-click** once to proceed with erasing the selected entities.

On your own, create a free-hand sketch of your choice using the **Line** command. Experiment with using the different commands we have discussed so far. Reset the status buttons so that only the **GRID DISPLAY** option is turned **ON** as shown.

The CAD Database and the User Coordinate System

Designs and drawings created in a CAD system are usually defined and stored using sets of points in what is called **world space**. In most CAD systems, the world space is defined using a three-dimensional **Cartesian coordinate system**. Three mutually perpendicular axes, usually referred to as the **X**-, **Y**-, and **Z**-axes, define this system. The intersection of the three coordinate axes forms a point called the **origin**. Any point in world space can then be defined as the distance from the origin in the **X**-, **Y**- and **Z**-directions. In most CAD systems, the directions of the arrows shown on the axes identify the positive sides of the coordinates.

A CAD file, which is the electronic version of the design, contains data that describes the entities created in the CAD system. Information such as the coordinate values in world space for all endpoints, center points, etc. along with the descriptions of the types of entities are all stored in the file. Knowing that AutoCAD stores designs by keeping coordinate data helps us understand the inputs required to create entities.

The icon near the bottom left corner of the default AutoCAD graphics window shows the positive **X**-direction and positive **Y**-direction of the coordinate system that is active. In AutoCAD, the coordinate system that is used to create entities is called the **user coordinate system (UCS)**. By default, the **user coordinate system** is aligned to the **world coordinate system (WCS)**. The **world coordinate system** is a coordinate system used by AutoCAD as the basis for defining all objects and other coordinate systems as defined by the user. We can think of the **origin** of the **world coordinate system** as a fixed point being used as a reference for all measurements. The default orientation of the **Z**-axis can be considered as positive values in front of the monitor and negative values inside the monitor.

Changing to the 2D UCS Icon Display

In AutoCAD 2017, the **UCS** icon is displayed in various ways to help us visualize the orientation of the drawing plane.

1. Click on the **View** pull-down menu and select

[Display] → [UCS Icon] → [Properties...]

2. In the **UCS icon style** section, switch to the **2D** option as shown.

3. Click **OK** to accept the settings.

Note the **W** symbol in the **UCS** icon indicates that the **UCS** is aligned to the **world coordinate system**.

Cartesian and Polar Coordinate Systems

In a two-dimensional space, a point can be represented using different coordinate systems. The point can be located, using a Cartesian coordinate system, as X and Y units away from the origin. The same point can also be located using the polar coordinate system, as r and θ units away from the origin.

For planar geometry, the polar coordinate system is very useful for certain applications. In the polar coordinate system, points are defined in terms of a radial distance, r, from the origin and an angle θ between the direction of r and the positive X axis. The default system for measuring angles in AutoCAD 2017 defines positive angular values as counter-clockwise from the positive X-axis.

Absolute and Relative Coordinates

AutoCAD 2017 also allows us to use absolute and relative coordinates to quickly construct objects. Absolute coordinate values are measured from the current coordinate system's origin point. Relative coordinate values are specified in relation to previous coordinates.

Note that the coordinate display area can also be used as a toggle switch; each left-mouse-click will toggle the coordinate display on or off.

In AutoCAD 2017, the absolute coordinates and the relative coordinates can be used in conjunction with the Cartesian and polar coordinate systems. By default, AutoCAD expects us to enter values in absolute Cartesian coordinates, distances measured from the current coordinate system's origin point. We can switch to using the relative coordinates by using the @ symbol. The @ symbol is used as the relative coordinates specifier, which means that we can specify the position of a point in relation to the previous point.

Defining Positions

In AutoCAD, there are five methods for specifying the locations of points when we create planar geometric entities.

- > Interactive method: Use the cursor to select on the screen.
- > Absolute coordinates (Format: X,Y): Type the X and Y coordinates to locate the point on the current coordinate system relative to the origin.
- > Relative rectangular coordinates (Format: @X,Y): Type the X and Y coordinates relative to the last point.
- > Relative polar coordinates (Format: @Distance<angle): Type a distance and angle relative to the last point.
- > Direct Distance entry technique: Specify a second point by first moving the cursor to indicate direction and then entering a distance.

GRID Style Setup

1. In the Status Bar area, right-mouse-click on SnapMode and choose [Snap settings].
2. In the Drafting Settings dialog box, select the Snap and Grid tabs if it is not the page on-top.

3. Change Grid Style to Display dotted grid in 2D model Space as shown in the below figure.

4. Pick OK to exit the Drafting Settings dialog box.

The GuidePlate

We will next create a mechanical design using the different coordinate entry methods.

The rule for creating CAD designs and drawings is that they should be created at full size using real-world units. The CAD database contains all the definitions of the geometric entities and the design is considered as a virtual, full-sized object. Only when a printer or plotter transfers the CAD design to paper is the design scaled to fit on a sheet. The tedious task of determining a scale factor so that the design will fit on a sheet of paper is taken care of by the CAD system. This allows the designers and CAD operators to concentrate their attention on the more important issues - the design.

1. Select the **Line** command icon in the Draw toolbar. In the command prompt area, near the bottom of the AutoCAD graphics window, the message ".line Specify first point:" is displayed. AutoCAD expects us to identify the starting location of a straight line.
2. We will locate the starting point of our design at the origin of the world coordinate system.
Command: .line Specify first point: 0,0 (Type 0,0 and press the [ENTER] key once.)

3. We will create a horizontal line by entering the absolute coordinates of the second point.
Specify next point or [Undo]: 5,5,0 [ENTER]

Note that the line we created is aligned to the bottom edge of the drawing window. Let us adjust the view of the line by using the Pan Realtime command.

4. In the Menu Bar area select: **[View] -> [Pan] -> [Realtime]**

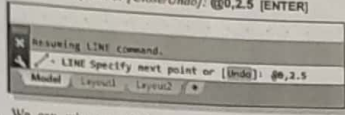

The available Pan commands enable us to move the view to a different position. The Pan-Realtime function acts as if you are using a video camera.

5. Move the cursor, which appears as a hand inside the graphics window, near the center of the drawing window, then push down the left-mouse-button and drag the display toward the right and top side until we can see the sketched line. (Notice the scroll bars can also be used to adjust viewing of the display.)

- Press the [Esc] key to exit the *Pan-Realtime* command. Notice that AutoCAD goes back to the *Line* command.
- We will create a vertical line by using the *relative rectangular coordinates entry method*, relative to the last point we specified:
Specify next point or [Close/Undo]: @0,2.5 [ENTER]

- We can mix any of the entry methods in positioning the locations of the endpoints. Move the cursor to the *Status Bar* area, and turn ON the *SNAP MODE* option.

Note that the *Line* command is resumed as the settings are adjusted.

- Left-click once on the coordinates display area to switch to a different coordinate display option. Note the coordinates display area has changed to show the length of the new line and its angle. Each click will change the display format of the cursor coordinates.

- On your own, left-click on the coordinates display area to observe the switching of the coordinate display; set the display back to using the world coordinate system.

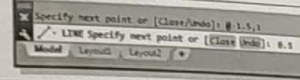

- Create the next line by picking the location, world coordinates (8,2.5), on the screen.

- We will next use the *relative polar coordinates entry method*, relative to the last point we specified:
Specify next point or [Close/Undo]: @3<90 [ENTER]
(Distance is 3 inches with an angle of 90 degrees.)

- Using the *relative rectangular coordinates entry method* to create the next line, we can imagine a *reference coordinate system* aligned at the previous point. Coordinates are measured along the two reference axes.
Specify next point or [Close/Undo]: @-1.5,1 [ENTER]
(-1.5 and 1 inches are measured relative to the reference point.)

- Move the cursor directly to the left of the last point and use the *direct distance entry technique* by entering 6.5 [ENTER].

- For the last segment of the sketch, we can use the *Close* option to connect back to the starting point. Inside the graphics window, right-mouse-click and a popup menu appears on the screen.

- Select *Close* with the left-mouse-button to connect back to the starting point and end the *Line* command.

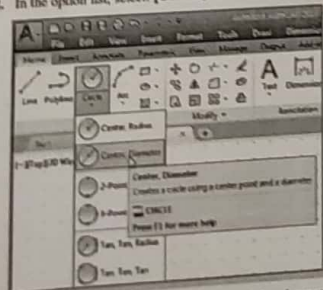

Creating Circles

- The menus and toolbars in AutoCAD 2017 are designed to allow the CAD operator to quickly activate the desired commands.

- In the *Draw* toolbar, click on the little triangle below the circle icon. Note that the little triangle indicates additional options are available.

- In the option list, select: [Center, Diameter]

Notice the different options available under the circle submenu:

- Center, Radius:** Draws a circle based on a center point and a radius.
- Center, Diameter:** Draws a circle based on a center point and a diameter.
- 2 Points:** Draws a circle based on two endpoints of the diameter.
- 3 Points:** Draws a circle based on three points on the circumference.
- TTR-Tangent, Tangent, Radius:** Draws a circle with a specified radius tangent to two objects.
- TTT-Tangent, Tangent, Tangent:** Draws a circle tangent to three objects.

- In the command prompt area, the message "Specify center point for circle or [3P/2P/Tr (tan tan radius)]:" is displayed. AutoCAD expects us to identify the location of a point or enter an option. We can use any of the four coordinate entry methods to identify the desired location. We will enter the world coordinates (2.5,3) as the center point for the first circle.
Specify center point for circle or [3P/2P/Tr (tan tan radius)]: 2.5,3 [ENTER]

- In the command prompt area, the message "Specify diameter of circle:" is displayed.
Specify diameter of circle: 2.5 [ENTER]

- Inside the graphics window, right-mouse-click to bring up the popup option menu.
- Pick *Repeat CIRCLE* with the left-mouse-button in the popup menu to repeat the last command.
- Using the *relative rectangular coordinates entry method*, relative to the center-point coordinates of the first circle, we specify the location as @2.5,2 [ENTER]

Specify center point for circle or [3P/2P/Tr (tan tan radius)]: @2.5,2 [ENTER]

8. In the command prompt area, the message "Specify Radius of circle: <2.50>" is displayed. The default option for the Circle command in AutoCAD is to specify the radius and the last radius used is also displayed in brackets.

9. Inside the graphics window, right-mouse-click to bring up the popup option menu and select Diameter as shown.

10. In the command prompt area, enter 1.5 as the diameter.

Specify Diameter of circle<2.50>: 1.5 [ENTER]

Saving the CAD Design

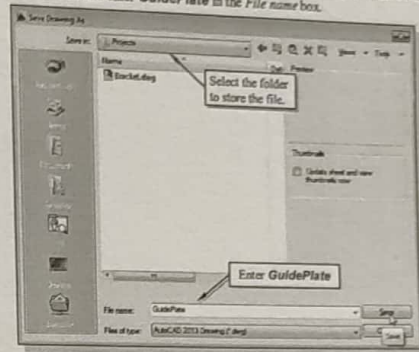

In the Application Menu, select:

Save (Ctrl+S)

Note the command can also be activated with the quick-key combination of [Ctrl]+[S].

2. In the Save Drawing As dialog box, select the folder in which you want to store the CAD file and enter GuidePlate in the File name box.

3. Click Save in the Save Drawing As dialog box to accept the selections and save the file. Note the default file type is DWG, which is the standard AutoCAD drawing format.

Close the Current Drawing

Several options are available to close the current drawing:

Select [Close] → [Current Drawing] in the Application Menu Bar as shown.

Enter Close at the command prompt.

The third option is to click on the [Close] icon located at the upper-right-hand corner of the drawing window.

The Spacer Design

We will next create the spacer design using more of AutoCAD's drawing tools.

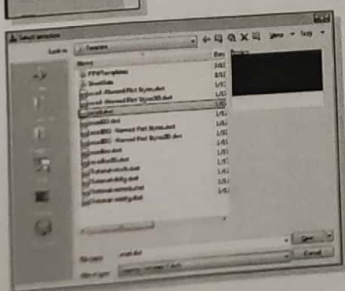

Start a New Drawing

1. In the Application Menu, select [New] to start a new drawing.

2. The Select Template dialog box appears on the screen. Click Open to accept the default acad.dwt as the template to open.

The dwt file type is the AutoCAD template file format. An AutoCAD template file contains pre-defined settings to reduce the amount of tedious repetitions.

Drawing Units Setup

Every object we construct in a CAD system is measured in units. We should determine the system of units within the CAD system before creating the first geometric entities.

1. In the Menu Bar select: [Format] → [Units]

The AutoCAD Menu Bar contains multiple pull-down menus where all of the AutoCAD commands can be accessed. Note that many of the menu items listed in the pull-down menus can also be accessed through the Quick Access toolbar and/or Ribbon panels.

2. Click on the Length Type option to display the different types of length units available. Confirm the Length Type is set to Decimal.

3. On your own, examine the other settings that are available.

4. In the *Drawing Units* dialog box, set the *Length Type* to *Decimal*. This will set the measurement to the default *English* units, inches.

- Set the *Precision* to two digits after the decimal point as shown in the above figure.
- Pick *OK* to exit the *Drawing Units* dialog box.

Drawing Area Setup

Next, we will set up the *Drawing Limits* by entering a command in the command prompt area. Setting the *Drawing Limits* controls the extents of the display of the *grid*. It also serves as a visual reference that marks the working area. It can also be used to prevent construction outside the grid limits and as a plot option that defines an area to be plotted/printed. Note that this setting does not limit the region for geometry construction.

- In the *Menu Bar* select: **[Format] → [Drawing Limits]**
- In the command prompt area, the message "*Reset Model Space Limits: Specify lower left corner or [On/Off] <0,0,0,0>:*" is displayed. Press the **ENTER** key once to accept the default coordinates **<0,0,0,0>**.

- In the command prompt area, the message "*Specify upper right corner <12.00,9.00>:*" is displayed. Press the **ENTER** key again to accept the default coordinates **<12.00,9.00>**.

Using the Line Command

- Select the *Line* command icon in the *Draw* toolbar. In the command prompt area, near the bottom of the AutoCAD graphics window, the message "*line Specify first point:*" is displayed. AutoCAD expects us to identify the starting location of a straight line.
- To further illustrate the usage of the different input methods and tools available in AutoCAD, we will **start the line segments at an arbitrary location**. Start at a location that is somewhere in the lower left side of the graphics window.

- We will create a horizontal line by using the *relative rectangular coordinates entry method*, relative to the last point we specified: **@6,0 [ENTER]**

- Next, create a vertical line by using the *relative polar coordinates entry method*, relative to the last point we specified: **@3<90 [ENTER]**

- Next, we will use the *direct input method*. First, move the cursor directly to the left of the last endpoint of the line segments.

- On your own, move the graphics cursor near the upper-right corner inside the drawing area and note that the drawing area is unchanged. (The *Drawing Limits* command is used to set the drawing area, but the display will not be adjusted until a display command is used.)

- Inside the *Menu Bar* area select: **[View] → [Zoom] → [All]**
 - The **Zoom All** command will adjust the display so that all objects in the drawing are displayed to be as large as possible. If no objects are constructed, the *Drawing Limits* are used to adjust the current viewport.
- Move the graphics cursor near the upper-right corner inside the drawing area, and note that the display area is updated.

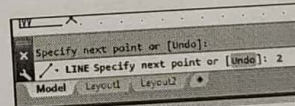

- In the *Status Bar* area, right-click on *SnapMode* and choose **[Snap Settings]**.

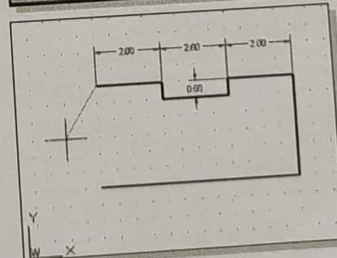

- In the *Drafting Settings* dialog box, switch on the *Snap* and *Grid* options as shown.

- On your own, exit the *Drafting Settings* dialog box and reset the status buttons so that only **GRID DISPLAY** and **SNAP MODE** are turned *ON* as shown.

- Use the *direct distance entry technique* by entering **2 [ENTER]**.

- On your own, repeat the above steps and create the four additional line segments, using the dimensions as shown.

- To end the line command, we can either hit the **[Enter]** key on the keyboard or use the **Enter** option, right-click and a *popup menu* appears on the screen.

Select **Enter** with the left-mouse-button to end the *Line*

Using the Erase Command

The vertical line on the right was created as a construction line to aid the construction of the rest of the lines for the design. We will use the Erase command to remove it.

1. Pick Erase in the Modify toolbar. The message "Select objects" is displayed in the command prompt area and AutoCAD awaits us to select the objects to erase.

2. Select the vertical line as shown.
3. Click once with the right-mouse-button to accept the selection and delete the line.

Using the Arc Command

Click the down-arrow icon of the Arc command in the Draw toolbar to display the different Arc construction options.

- AutoCAD provides eleven different ways to create arcs. Note that the different options are used based on the geometry conditions of the design. The more commonly used options are the 3-Points option and the Center-Start-End option.
2. Select the Center-Start-End option as shown. This option requires the selection of the center point, start point and end point location, in that order, of the arc.

3. Move the cursor to the middle of the two horizontal lines and click the cursor to the two endpoints as shown. Click once with the right-mouse-button to select the location as the center point of the new arc.

4. Move the cursor downward and select the right endpoint of the bottom horizontal line as the start point of the arc.

5. Move the cursor to the right endpoint of the top horizontal line as shown. Pick this point as the endpoint of the new arc.

6. On your own, repeat the above steps and create the other arc as shown. Note that in most CAD packages, positive angles are defined as going counterclockwise; therefore, the starting point of the second arc should be at the endpoint on top.

Using the Circle Command

1. Select the [Circle] → [Center, Diameter]

2. Select the same location for the arc center as the center point for the new circle.
3. In the command prompt area, the message "Specify diameter of circle:" is displayed. Specify diameter of circle: 1.25 [ENTER]

4. On your own, create the other circle and complete the drawing as shown.

Saving the CAD Design

1. In the Quick Access Toolbar, select [Save]

- Note the command can also be activated with the quick-key combination of [Ctrl]+[S].

2. In the Save Drawing As dialog box, select the folder in which you want to save the CAD file and enter Spacer in the File name box.

3. Click Save in the Save Drawing As dialog box to accept the selections and save the file. Note the default file type is DWG, which is the standard AutoCAD drawing format.

Exit AutoCAD 2017

- To exit AutoCAD 2017, select Exit AutoCAD in the Menu Bar or type QUIT at the command prompt. Note the command can also be activated with the quick-key combination of [Ctrl]+[Q].

AutoCAD 2017

Tutorial Second Level

3D Modeling

Chapter 3 3D Wireframe Modeling

Learning Objectives

- Use the Setup Wizard
- Create Wireframe Models
- Apply the Box Method in Creating Models
- Construct with the Copy Command
- Understand the Available 3D Coordinates Input Options
- Use the View Toolbar
- Set up and Use the TRIM options

Introduction

The first true 3D computer model created on CAD systems in the late 1970s was the 3D wireframe model. Computer-generated 3D wireframe models contain information about the locations of all the corners and edges in space coordinates. The 3D wireframe models can be viewed from any direction as needed and are in general reasonably good representations of 3D design. But because surface definition is not part of a wireframe model, all wireframe images have the inherent problem of ambiguity. For example, in the figure displayed below, which corner is in front, corner A or corner B? The ambiguity problem becomes much more serious with complex designs that have many edges and corners.

Wireframe Ambiguity: Which corner is in front, A or B?

The main advantage of using a 3D wireframe modeler to create 3D models is its simplicity. The computer hardware requirements for wireframe modelers are typically much lower than the requirements for surface and solid modelers. A 3D wireframe model, also known as a stick-figure model or a skeleton model, contains only information about the locations of all the corners and edges of the design in space coordinates. You should also realize that, in some cases, it could be quite difficult to locate some of the corner locations while creating a 3D wireframe model. Note that 3D wireframe modelers are usually used in conjunction with surfacing modelers, which we will discuss in the later chapters of this text, to eliminate the problem of ambiguity.

With most CAD systems, creating 3D wireframe models usually starts with constructing 2D entities in 3D space. Two of the most commonly used methods for creating 3D wireframe models are the Box method and the 3D Extrusion method. As the name implies, the Box method involves the creation of a 3D box with the edges constructed from the overall height, width and depth dimensions of the design. The 3D wireframe model is typically completed by locating and connecting corners within the box.

The *2D Extrusion method* involves making copies of 2D geometries in specific directions. This method is similar to the 2½D extrusion approach illustrated in the previous chapter (Chapter 2) with several differences. First of all, we do not really extrude the wireframe entities; instead we simply make copies of wireframe entities in the desired directions. Secondly, constructed wireframe entities have true 3D space coordinates, while the *thickness* approach creates entities with no true 3D coordinates. Finally, no surfaces are created in the 3D wireframe models.

In this chapter, we will illustrate the general procedure to construct a 3D wireframe model using both the box method and the 2D extrusion method. To illustrate the AutoCAD 3D construction environment, we will create the wireframe model using only the default UCS system, which is aligned to the world coordinate system. Repositioning and/or reorienting the User Coordinate System can be useful in creating 3D models. However, it is also feasible to create 3D models referencing only a single coordinate system. One important note about creating wireframe models is that the construction techniques mostly concentrate on locating the space coordinates of the individual corners of the design. The ability to visualize designs in the form of 3D wireframe models is extremely helpful to designers and CAD operators. It is hoped that the experience of thinking and working on 3D wireframe models, as outlined in this chapter, will enhance one's 3D visualization ability.

The Locator Design

Starting Up AutoCAD 2017

1. Start AutoCAD 2017 by selecting the *Autodesk* folder in the **Start** menu as shown. Once the program is loaded into the memory, click **Start Drawing** to start a new drawing.

Activate the Startup Option

- ◆ In AutoCAD 2017, we can use the *Startup* dialog box to establish different types of drawing settings. The *Startup* dialog box can be activated through the use of the **STARTUP** system variable.

The **STARTUP** system variable can be set to 0, 1, 2 or 3:

- 1: displays the *Create New Drawing* dialog box.
- 0: displays the *Select Template* dialog box (default).
- 2: Displays the *Start Tab* with options; a custom dialog box can be used.
- 3: Displays the *Start Tab* with the ribbon pre-loaded (default).

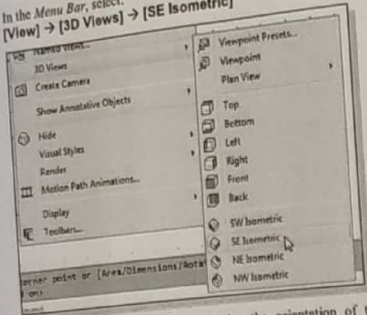

1. In the *command prompt area*, enter the system variable name:

2. Enter **1** as the new value for the **STARTUP** system variable.

5. In the *Menu Bar*, select: **[View] → [3D Views] → [SE Isometric]**

• Notice the orientation of the sketched 2D rectangle in relation to the displayed AutoCAD user coordinate system. By default, the 2D sketch-plane is aligned to the XY plane of the world coordinate system.

Create a 3D Box

• We will create a 3D box to define the 3D boundary of the design. We will do so by placing a copy of the base rectangle at the corresponding height elevation of the design. The dimensions of the 3D box are therefore based on the height, width and depth dimensions of the design.

Click on the **Copy Object** icon in the *Modify*

- In the command prompt area, the message "Select objects:" is displayed. Pick any edge of the sketched rectangle.
- Inside the graphics window, right-click once to accept the selection.

- In the command prompt area, the message "Specify base point or [Multiple]:" is displayed. Pick any corner of the sketched rectangle as a base point to create the copy.
- In the command prompt area, the message "Specify second point of displacement or <use first point as displacement>:" is displayed. Enter **@0,0,2.5 [ENTER]**. (The three values are the X, Y and Z coordinates of the new location.)

6. Select the **[Zoom Extents]** option in the *View pull-down* menu to view the constructed geometry.

• The two rectangles represent the top and bottom of a 3D box defining the 3D boundary of the design. Note that the construction of the second rectangle was independent of the UCS, *User Coordinate System*; the UCS is still aligned to the world coordinate system.

7. Select the **Line** icon in the *Draw toolbar*.

8. In the command prompt area, the message "*_line Specify first point:*" is displayed. Command: **_line Specify first point:**

9. In the command prompt area, the message "*Specify next point or [Undo]:*" is displayed. Command: **_line Specify first point: 0,0,2.5 [ENTER]**.

- Select the **LINE** icon in the **Draw** toolbar.
- In the command prompt area, the message "Specify first point or [Undo]:" is displayed. Pick the top back corner in the Object Snap toolbar.
- Select the top back corner as the reference point as shown.
- In the command prompt area, the message "Specify second point or [Undo]:" is displayed. Pick the top back corner as the reference point as shown. Command: `@0,75,0,0 (ENTER)`.
- By using the relative coordinate input method, we can locate the position of any point in 3D space. Note that the entered coordinates are measured relative to the current line.
- In the command prompt area, the message "Specify next point or [Undo]:" is displayed. Command: "Specify next point or [Undo]: @0,0,0 (ENTER)".
- Move the cursor toward the left to create a perpendicular line. Select a location that is on the back line as shown, making the displayed Object Snap/Tracking list: Point, Intersection.
- In the command prompt area, the message "Specify next point or [Undo]:" is displayed. Select **Repeat First** in the Object Snap toolbar.

- Select the top back corner as the reference point as shown.
- In the command prompt area, the message "Specify second point or [Undo]:" is displayed. Pick the top back corner as the reference point as shown. Command: `@0,75,0,0 (ENTER)`.
- Select the top back corner as the reference point as shown.
- In the command prompt area, the message "Specify second point or [Undo]:" is displayed. Pick the top back corner as the reference point as shown. Command: `@0,0,0 (ENTER)`.
- Move the cursor to the top corner as shown in the figure.
- Using the **Object Snap** toolbar and the relative coordinate input method, click on to specify locate point in 3D space.
- Inside the graphics window, right-click to activate the option menu and select **Repeat First** with the left mouse button to add the LINE command.

Use the Copy Option to Create Additional Edges

The **Copy** option can also be used to create additional edges of the wireframe model.

- Click on the **Copy Object** icon in the **Modify** toolbar.
- In the command prompt area, the message "Select object:" is displayed. Pick any edge of the bottom rectangle.
- Inside the graphics window, right-click once to accept the selection.
- In the command prompt area, the message "Specify base point or displacement, or [Undo]:" is displayed. Pick any corner of the base rectangle to be used as a base point to create the copy.

- In the command prompt area, the message "Specify second point of displacement or =use first point as displacement:" is displayed. Enter `@0,0,0,75 (ENTER)`.
- Inside the graphics window, right-click to bring up the pop-up option menu.
- Pick **Repeat Copy Object** with the left mouse button in the pop-up menu to repeat the last command.
- Pick the two vertical lines on the right side of the 3D box as shown.
- Inside the graphics window, right-click once to accept the selection.
- In the command prompt area, the message "Specify base point or displacement, or [Multiple]:" is displayed. Pick the top back corner of the wireframe as a base point to create the copy.

- In the command prompt area, the message "Specify second point of displacement or =use first point as displacement:" is displayed. Pick the top back corner of the wireframe model as shown.

The copy option is an effective way to create additional edges of wireframe models, especially when multiple objects are involved. With wireframe models, the emphasis is placed on the corners and edges of the model.

Use the Trim Command

The **Trim** command can be used to shorten objects so that they end precisely at selected boundaries.

- Select the **Trim** command icon in the **Modify** toolbar. In the command prompt area, the message "Select boundary edges... Select objects:" is displayed. First we will select the objects that define the boundary edges to which we want to trim the object.
- Pick the highlighted edges as shown in the figure; these edges are the boundary edges.
- Inside the graphics window, right-click once to accept the selection of boundary edges and proceed with the **Trim** command.

Create a Circle above the UCS Sketch Plane

1. Select the **Circle** command icon in the *Draw* toolbar.
- By default, the XY plane of the UCS defines the sketching plane for constructing 2D geometric entities.

2. In the command prompt area, the message "*circle Specify center point for circle or [3P/2P/Ttr (tan radius)]:*" is displayed. Select **Snap From** in the *Object Snap* toolbar.

3. Select the **top right corner** as the reference point as shown.

4. In the command prompt area, the message "*Specify next point or [Close/Undo]: from Base point <Offset>:*" is displayed.

Command: @-2.67,1.5 [ENTER].

5. In the command prompt area, the message "*Specify radius of circle or [Diameter]:*" is displayed.

Command: 0.375 [ENTER].

- The circle is created above the sketching plane with the **Snap From** option.

6. Select the **Line** icon in the *Draw* toolbar.

7. On your own, create the lines connecting the corners of the created edges as shown in the figure below.

8. Use the **Snap to Quadrant** option to create edges in between the two circles.

9. Select the **Trim** command icon in the *Modify* toolbar.

10. On your own, trim the center portion of the bottom right edge and complete the wireframe model as shown.

♦ On your own, save the **Locator** design (Locator.dwg); this model will be used again in the *Surface Modeling* chapter.

Complete the Wireframe Model

Click on the **Copy Object** icon in the *Modify*

2. In the command prompt area, the message "*Select objects:*" is displayed. Pick the edges and the circle as shown in the figure.

3. Inside the graphics window, right-click once to accept the selection.

4. In the command prompt area, the message "*Specify base point or displacement, or [Multiple]:*" is displayed. Pick the front right corner as shown.

5. In the command prompt area, the message "*Specify second point of displacement or <use first point as displacement>:*" is displayed. Pick the bottom-right corner as shown.

Review Questions:

1. Describe some of the control options available with the **Free Orbit** command.
2. List and describe two different methods to create 3D edges from existing 3D edges in **AutoCAD® 2017**.
3. How many of the UCS options were used to create the 3D model in this chapter and how many were used to create the model in the previous chapter?
4. When and why would you use the **Trim-Project-View** option?
5. Identify the following commands:
